Module 8: Inequalities in Triangles

A. Learning Outcomes

All activities and inputs in this module that you have to facilitate are aligned with the content and performance standards of the K to 12 Mathematics Curriculum for Grade 8. Ensuring that students undertake all the activities at the specified time with your maximum technical assistance lies under your care. The table below shows how the standards are unpacked.

UNPACKING THE STANDARDS FOR UNDERSTANDING

<table>
<thead>
<tr>
<th>SUBJECT:</th>
<th>LEARNING COMPETENCIES</th>
</tr>
</thead>
</table>
| Grade 8 Mathematics | • **(KNOWLEDGE)** State and illustrate the theorems on triangle inequalities such as exterior angle inequality theorem, triangle inequality theorems, hinge theorem and its converse.  
• **(SKILL)** Apply theorems on triangle inequalities to:  
  a. determine possible measures for the angles and sides of triangles.  
  b. justify claims about the unequal relationships between side and angle measures.  
• **(SKILL)** Use the theorems on inequalities in triangles to prove statements involving triangle inequalities. |

<table>
<thead>
<tr>
<th>ESSENTIAL UNDERSTANDING:</th>
<th>ESSENTIAL QUESTION:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Students will understand that inequalities in triangles can be justified deductively.</td>
<td>How can you justify inequalities in triangles?</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>TRANSFER GOAL:</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Students will on their own justify inequalities in triangles that are evident in the things around us such as in artworks and designs.</td>
<td></td>
</tr>
</tbody>
</table>
B. Planning for Assessment

To assess learning, students should perform a task to demonstrate their understanding of Inequalities in Triangles. It is expected that students, having been equipped with knowledge and skills on inequalities in triangles, would come up with a product—a design and a miniature model of a folding ladder that can reach as high as 10 feet. This task is found in Activity No. 23 of the module.

Assessment Map

To ensure understanding and learning, students should be engaged in different learning experiences with corresponding assessment. The table below shows the assessment at different stages of the learning process. Details of this assessment map will guide you which items in each stage of assessment are under specific domains—Knowledge, Process/Skills, Understanding or Performance. Be sure to expose students to varied assessment in this module in order to develop their critical thinking and problem solving skills.

**Activity:** Creation of a Design or Product

**Scoring:** By Rubrics
C. Planning for Teaching-Learning

Introduction:

The unit lesson on Geometry for Grade 8 is to be delivered in the Third Quarter of the school year. Triangle Inequalities is the third chapter of Geometry for Grade 8. Since there are four chapters in this unit, you are expected to facilitate this lesson within 15 days, non-inclusive of extra time student spend for tasks that you may most likely assign for students to do in their independent/cooperative learning time, free time, or after school.

INTRODUCTION AND FOCUS QUESTIONS:

Aside from arresting the attention and interest of the students, the introduction stresses the purpose of studying inequalities in triangles.

The introduction, through the essential question, serves as a steering mechanism of the lesson. All sections and activities in the lesson are geared towards the goal of answering it.

As the learning facilitator, your role is to emphasize the Essential Question in the introduction and to remind the students about it in every section of the module.

Your key role is to underscore that the process of answering the essential question on how inequalities in triangles can be justified will:

• improve their attention to details;
• shape their deductive thinking;
• hone their reasoning skills; and
• polish their mathematical communication.
LESSONS AND COVERAGE:

This section of the learning module cites the subtopics of Inequalities in Triangles and the competencies that will be covered in the module. Your task is to know these competencies so you can ensure that students shall have learned them at the end of the lesson.

MODULE MAP:

Through the Module Map, you will be able to show to the students that

- inequalities exist in one triangle and in two triangles
- four theorems can be developed, verified, and proved regarding inequalities in one triangle
- two theorems can be developed, verified, and proved regarding inequalities in two triangles

PRE-ASSESSMENT:

This section features the test that diagnoses what students already know about the topic before the actual teaching of the lesson. This feedback information is valuable to you because it directs you on how to proceed as a facilitator of learning. As a result, you are able to provide the appropriate technical assistance students need as the lesson unfolds.
Answer Key to Pre-Test

1. **C** The measure of an exterior angle of a triangle is always greater than either remote interior angle. Basis: Exterior Angle Inequality Theorem.

2. **B** Angle 5 is an exterior angle of triangle TYP because segment PR is an extension of side TP. Basis: Definition of Exterior Angle.

3. **B** Marie was not able to form a triangle because the sum of the two shorter lengths 4 and 5 is not greater than the third side of 9 inches. Basis: Triangle Inequality Theorem 3 \( S_1 + S_2 > S_3 \).

4. **A** Working Inequality \( 4x - 3 < 42 \° \)
   Basis: Triangle Inequality Theorem 3 \( S_1 + S_2 > S_3 \)

5. **B** Basis: Converse of Hinge Theorem

6. **B** The included angle between two distances 3 km and 4 km covered by Oliver is 150°. This is larger than that of Ruel's 140°. Therefore, Oliver is father because his distance is opposite a larger angle. Basis: Hinge Theorem.

7. **B**

8. **C** Basis: Converse of Hinge Theorem.

9. **B** Conclusions must be based on complete facts.

10. A \( m\angle D = 180 - (86 + 49) = 45 \). The shortest side is \( \angle D \). Therefore the shortest side is opposite it. Basis: Triangle Inequality Theorem 2 \( (Aa \rightarrow Ss) \)

11. **C**
   - Considering the triangle with sides \( p, q \) and \( s \):
     The angle opposite \( p \) is 61°. Hence, \( s < q < p \).
   - Considering the triangle with sides \( r, s \) and \( t \):
     The angle opposite \( r \) is 60°. Hence, \( t < r < s \).
   Combining both results, \( t < r < s < q < p \)
   Basis: Triangle Inequality Theorem \( (Aa \rightarrow Ss) \)

III. PRE - ASSESSMENT

Find out how much you already know about this topic. On a separate sheet, write only the letter of the choice that you think best answers the question. Please answer all items. During the checking, take note of the items that you were not able to answer correctly and find out the right answers as you go through this module.

1. The measure of an exterior angle of a triangle is always ____________.
   a. greater than its adjacent interior angle.
   b. less than its adjacent interior angle.
   c. greater than either remote interior angle.
   d. less than either remote interior angle.

2. Which of the following angles is an exterior angle of \( \triangle TYP \)?
   A. \( \angle 4 \)  B. \( \angle 5 \)  C. \( \angle 6 \)  D. \( \angle 7 \)

3. Each of Xylie, Marie, Angel and Chloe was given an 18-inch piece of stick. They were instructed to create a triangle. Each cut the stick in their own chosen lengths as follows: Xylie—6 in, 6 in, 6 in; Marie—4 in, 5 in, 9 in; Angle—7 in, 5 in, 6 in; and Chloe—3 in, 7 in, 5 in. Who among them was not able to make a triangle?
   a. Xylie  b. Marie  c. Angel  d. Chloe

4. What are the possible values for \( x \) in the figure?
   a. \( x < 11.25 \)  c. \( x \leq 11.25 \)
   b. \( x > 11.25 \)  d. \( x \geq 11.25 \)
12. C Basis: Triangle Inequality Theorem ($S_1 \rightarrow A_1$)
13. C Basis: Triangle Inequality Theorem ($A_2 \rightarrow S_2$)
14. B Basis: Triangle Inequality Theorem 3 ($S_1 + S_2 > S_3$)
15. B
16. D
17. D

18. C III mostly conveys wrong signal to a client.
19. A
20. D

5. From the inequalities in the triangles shown, a conclusion can be reached using the converse of hinge theorem. Which of the following is the last statement?

![Diagram of triangles with sides 10, 10, 8 and 8, 8, 10.]

a. $HM \cong HM$
   c. $HO \cong HE$

b. $m\angle OHM > m\angle EHM$
   d. $m\angle EHM > m\angle OHM$

6. Hikers Oliver and Ruel who have uniform hiking speed walk in opposite directions—Oliver, eastward whereas Ruel, westward. After walking three kilometers each, both of them take left turns at different angles—Oliver at an angle of $30^\circ$ and Ruel at $40^\circ$. Both continue hiking and cover another four kilometers each before taking a rest. Which of the hikers is farther from their point of origin?

a. Ruel
   b. Oliver
   c. It cannot be determined.
   d. Ruel is as far as Oliver from the rendezvous.

7. Which of the following is the accurate illustration of the problem?

![Four diagrams illustrating different paths and angles.]

a. 
   b. 
   c. 
   d. 
8. The chairs of a swing ride are farthest from the base of the swing tower when the swing ride is at full speed. What conclusion can you make about the angles of the swings at different speeds?

a. The angles of the swings remain constant whether the speed is low or full.
b. The angles of the swings are smaller at full speed than at low speed.
c. The angles of the swings are larger at full speed than at low speed.
d. The angles of the swings are larger at low speed than at full speed.

9. Will you be able to conclude that EM > EF if one of the following statements is not established: AE ≅ AM, AF ≅ AM, m∠MAE > m∠FAE?

a. Yes, I will.
b. No, I won’t.
c. It is impossible to decide.
d. It depends on which statement is left out.

10. Which side of ∆GOD is the shortest?

a. GO  
 b. DO  
 c. DG  
 d. GD

11. The diagram is not drawn to scale. Which of the following combined inequalities describes p, q, r, s, and t?

a. p < q < r < s < t  
 b. s < p < q < r < t  
 c. t < r < s < q < p  
 d. q < p < t < r < s
12. In \( \triangle TRU \), \( TR = 8 \text{ cm}, RU = 9 \text{ cm}, \text{ and } TU = 10 \text{ cm} \). List the angles in order from least to greatest measure.

   a. \( m\angle T, m\angle R, m\angle U \)
   b. \( m\angle U, m\angle T, m\angle R \)
   c. \( m\angle R, m\angle T, m\angle U \)
   d. \( m\angle U, m\angle R, m\angle T \)

13. List the sides of \( \triangle LYK \) in order from least to greatest measure.

   a. \( LY, YK, KL \)
   b. \( YK, LY, KL \)
   c. \( YK, KL, LY \)
   d. \( YL, KL, LY \)

14. What is the range of the values of the diagonal \( d \) of a lot shaped like a parallelogram if adjacent sides are 10 inches and 14 inches?

   a. \( 4 \leq d \leq 24 \)
   b. \( 4 < d < 24 \)
   c. \( 4 \leq d \leq 24 \)
   d. \( 4 > d > 24 \)

For items no. 15-20, use the figure shown.

15. A balikbayan chose you to be one of the contractors to design an A-frame house maximizing the size of two square lots with dimensions 18 ft and 24 ft on each side. Which of the following is affected by the dimensions of the lot if the owner would like to spend the same amount of money on the roofs?

   I. The width of the base of the house frames
   II. Design of the windows
   III. The height of the houses
   IV. The roof angles

   a. I and IV
   b. III and IV
   c. II, III and IV
   d. I, II, III, and IV
16. Which of the following theorems justifies your response in item no. 15?
   I. Triangle Inequality Theorem 1
   II. Triangle Inequality Theorem 2
   III. Triangle Inequality Theorem 3
   IV. Hinge Theorem
   V. Converse of Hinge Theorem
   a. I, II, and III  b. IV only  c. IV and V  d. V only

17. If the owner would like the same height for both houses, which of the following is true?
   I. Roof costs for the larger lot is higher than that of the smaller lot.
   II. The roof of the smaller house is steeper than the larger house.
   a. I only  c. neither I nor II
   b. II only  d. I and II

18. What considerations should you emphasize in your design presentation so that the balikbayan would award you the contract to build the houses?
   I. Kinds of materials to use considering the climate in the area
   II. Height of floor-to-ceiling corner rooms and its occupants
   III. Extra budget needed for top-of-the-line furnishings
   IV. Architectural design that matches the available funds
   V. Length of time it takes to finish the project
   a. I, II, and IV  c. I, II, IV, and V
   b. I, IV, and V  d. I, II, III, IV, V

19. Why is it not practical to design a house using A-Frame style in the Philippines?
   I. A roof also serving as wall contributes to more heat in the house.
   II. Placement of the windows and doors requires careful thinking.
   III. Some rooms of the house would have unsafe low ceiling.
   IV. An A-Frame design is an unusually artful design.
   a. I and III  c. I, II, and III
   b. II and IV  d. I, II, III, IV

20. Why do you think an A-Frame House is practical in countries with four seasons?
   A. The design is customary.
   B. An artful house is a status symbol.
   C. The cost of building is reasonably low.
   D. The snow glides easily on steep roofs.
Lesson 1  
Inequalities in Triangles

What to Know

Let’s start the module by doing three activities that will reveal your background knowledge on triangle inequalities.

Activity No.1: My Decisions Now and Then Later

Let’s perform activity No. 1 in at most 5 minutes. Inform the students that there is no right or wrong answer because the activity is only intended to find out their background knowledge on Inequalities in Triangles. Tell them these: Your answers can be modified after tackling the module. Hence, there will be no checking of your responses. Hence, the answer key that follows is used to check their final answers after tackling the module.

Activity 1 MY DECISIONS NOW AND THEN LATER

Directions:
1. Replicate the table below on a piece of paper.
2. Under the my-decision-now column of the first table, write A if you agree with the statement and D if you don’t.
3. After tackling the whole module, you will be responding to the same statements using the second table.

<table>
<thead>
<tr>
<th>Statement</th>
<th>My Decision Now</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. To form a triangle, any lengths of the sides can be used.</td>
<td>D</td>
</tr>
<tr>
<td>2. The measure of the exterior angle of a triangle can be greater than the measure of its two remote interior angles.</td>
<td>D</td>
</tr>
<tr>
<td>3. Straws with lengths 3 inches, 4 inches and 8 inches can form a triangle.</td>
<td>A</td>
</tr>
<tr>
<td>4. Three segments can form a triangle if the length of the longest segment is greater than the difference but less than the sum of the two shorter segments.</td>
<td>A</td>
</tr>
<tr>
<td>5. If you want to find for the longest side of a triangle, look for the side opposite the largest angle.</td>
<td>A</td>
</tr>
</tbody>
</table>

My Decision Later

<table>
<thead>
<tr>
<th>Statement</th>
<th>My Decision Later</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. To form a triangle, any lengths of the sides can be used.</td>
<td>A</td>
</tr>
<tr>
<td>2. The measure of the exterior angle of a triangle can be greater than the measure of its two remote interior angles.</td>
<td>A</td>
</tr>
<tr>
<td>3. Straws with lengths 3 inches, 4 inches and 8 inches can form a triangle.</td>
<td>A</td>
</tr>
<tr>
<td>4. Three segments can form a triangle if the length of the longest segment is greater than the difference but less than the sum of the two shorter segments.</td>
<td>A</td>
</tr>
<tr>
<td>5. If you want to find for the longest side of a triangle, look for the side opposite the largest angle.</td>
<td>A</td>
</tr>
</tbody>
</table>

Before engaging the students in the different activities you have to underscore the following to the students:

Mathematical Connection — learning new lessons requires the use of lessons previously learned;
Cooperative Learning — learning is much easier, faster, more meaningful and more fun when working with group mates;
Engagement — learning is maximized through active performance of students in all activities.

Answer Key to Activity No.1

1. D
2. D (can be should be replaced with is always)
3. D
4. A
5. A

415
**Artistically Yours**

Your task is to get students interested in the new lesson. You may start by posing this task: What objects around us are triangular in shape? You and your students will find out that most objects are circular or rectangular.

After a 2-minute discussion, divide the class into groups and let them study the pictures and answer the questions in ponder time of Activity No. 2 Artistically Yours for at least three minutes. Let all group representatives report their answers to the questions. Give each representative at most one minute each to be able to maximize time. Process all their answers by unifying all their ideas or supplementing them so it would converge to the expected answers provided.

Invite also the students to discover more triangular designs and artworks by locating them in www.google.com under Images. Instruct them to type any of the following in the search bar: triangular designs, triangular artworks, triangular architecture, triangular art, and more.

---

**Answer Key to Activity No.2**

1. Triangles
2. Yes. Some sides are longer than the others and some corners are larger than the others.
3. Possible Answers: Interesting, Practical, creative, artful
4. Because they have not tackled the lesson yet, possible Answer: Inequalities in triangles in these artworks and designs are necessary in order to achieve beauty, artistry, creativity, and usefulness to the designs.

---

**Teacher’s Note and Reminders**

Don’t forget!

---

**Activity 3**

**Hello, Dear Concept Contractor!**

The figure on the next page is a concept museum of inequalities in triangles. You will be constructing this concept museum throughout this module.

Each portion of the concept museum, mostly triangular, poses a task for you to perform. All tasks are related to knowledge and skills you should learn about inequalities in triangles.
Activity No.3: Hello, Dear Concept Contractor!

Your task is to make students understand the activity. To do that, these are the things that you need to do:

- Check and strengthen their understanding of the definitions of contractor and museum;
- Explain that the finished concept museum will display all the concepts and skills about inequalities in triangles and seeing the tasks at this point provides them an overview of the lesson.
- Point out that building the concept museum takes time—that there’s a possibility that they may not be able to do any of the tasks listed on the triangles yet but they know already what to expect to learn. Thus, at the end of the lesson, they will be able to encapsulate all the concepts and skills on inequalities in triangles using the concept museum.
- Let them see that in order for them to completely build the concept museum, they need to perform all the activities in the succeeding sections.

You need to master the concepts and skills of the whole module. To facilitate that, study the completely built concept museum. Note that the students must have built their concept museums at the end of this lesson.

In short, the students have the option not to perform any task yet. The activity is just for presentation in order to direct the students of one goal—to build the concept museum as the lesson unfolds.

The presentation of this activity must take at least five minutes.

Teacher’s Note and Reminders

Note that the triangles in this concept museum are not drawn to scale and all sides can be named using their endpoints. Consider using numbers to name the angles of these triangles.

Notice that markings are shown to show which angles are larger and which sides are longer. These markings serve as your hints and clues. Your responses to the tasks must be justified by naming all the theorems that helped you decide what to do.

How many tasks of the concept museum can you tackle now?

Replicate two (2) copies of the unfilled concept museum. Use the first one for your responses to the tasks and the second one for your justifications.
A. Responses

1. If \( \angle 1 > \angle 2 \), then \( \angle THT > \angle ETH \).
2. If \( \angle BKF > \angle MXK \), then \( \angle TH > \angle TH \).
3. If \( \angle HX > \angle EN \), then \( \angle HX > \angle EN \).
4. If \( \angle MXK = \angle EN \), then \( \angle MXK > \angle EN \).

B. Justifications

1. Exterior Angle Inequality Theorem
2. Triangle Inequality Theorem
3. Converse of Hinge Theorem
4. Triangle Inequality Theorem
5. Exterior Angle Inequality Theorem

Answer Key to Activity No.3

Are you excited to completely build your concept museum, Dear Concept Contractor? The only way to do that is by doing all the succeeding activities in the next section of this module. The next section will also help you answer this essential question raised in the activity Artistically Yours: How can you justify inequalities in triangles?

The next lesson will also enable you to do the final project that is inspired by the artworks shown in Artistically Yours. When you have already learned all the concepts and skills related to inequalities in triangles, you will be required to make a model of a folding ladder and justify the triangular features of its design. Your design and its justification will be rated according to these rubrics: accuracy, creativity, efficiency, and mathematical justification.

What to Process

Your first goal in this section is to develop and verify the theorems on inequalities in triangles. To succeed, you need to perform all the activities that require investigation.

When you make mathematical generalizations from your observations, you are actually making conjectures just like what mathematicians do. Hence, consider yourself little mathematicians as you perform the activities.

Once you have developed these theorems, your third goal is to prove these theorems. You have to provide statements and/or reasons behind statements used to deductively prove the theorems.

The competence you gain in writing proofs enables you to justify inequalities in triangles and in triangular features evident in the things around us.

Before you go through the process, take a few minutes to review and master again the knowledge and skills learned in previous geometry lessons. The concepts and skills on the following topics will help you succeed in the investigatory and proof-writing activities.

1. Axioms of Equality
   1.1 Reflexive Property of Equality
      • For all real numbers \( p, p = p \).
   1.2 Symmetric Property of Equality
      • For all real numbers \( p \) and \( q \), if \( p = q \), then \( q = p \).
   1.3 Transitive Property of Equality
      • For all real numbers \( p, q, \) and \( r \), if \( p = q \) and \( q = r \), then \( p = r \).
   1.4 Substitution Property of Equality
      • For all real numbers \( p \) and \( q \), if \( p = q \), then \( q \) can be substituted for \( p \) in any expression.
2. Properties of Equality

2.1 Addition Property of Equality
   - For all real numbers $p$, $q$, and $r$, if $p = q$, then $p + r = q + r$.

2.2 Multiplication Property of Equality
   - For all real numbers $p$, $q$, and $r$, if $p = q$, then $pr = qr$.

3. Definitions, Postulates and Theorems on Points, Lines, Angles and Angle Pairs

3.1 Definition of a Midpoint
   - If points $P$, $Q$, and $R$ are collinear ($P – Q – R$) and $Q$ is the midpoint of $PR$, then $PQ \cong QR$.

3.2 Definition of an Angle Bisector
   - If $QS$ bisects $\angle PQR$, then $\angle PQS \cong \angle SQR$.

3.3 Segment Addition Postulate
   - If points $P$, $Q$, and $R$ are collinear ($P – Q – R$) and $Q$ is between points $P$ and $R$, then $PQ + QR \cong PR$.

3.4 Angle Addition Postulate
   - If point $S$ lies in the interior of $\angle PQR$, then $\angle PQS + \angle SQR \cong \angle PQR$.

3.5 Definition of Supplementary Angles
   - Two angles are supplementary if the sum of their measures is $180^\circ$.

3.6 Definition of Complementary Angles
   - Two angles are complementary if the sum of their measures is $90^\circ$.

3.7 Definition of Linear Pair
   - Linear pair is a pair of adjacent angles formed by two intersecting lines.

3.8 Linear Pair Theorem
   - If two angles form a linear pair, then they are supplementary.

3.9 Definition of Vertical Angles
   - Vertical angles refer to two non-adjacent angles formed by two intersecting lines.

3.10 Vertical Angles Theorem
    - Vertical angles are congruent.

4. How to Measure Angles using a Protractor

   Internet Learning
   Mastering the Skill in Estimating Measures of Angles
   Interactive:
   Games:
   - http://www.bbc.co.uk/schools/teachers/ks2_activities/maths/angles.shtml
   - http://www.innovationslearning.co.uk/subjects/maths/activities/year6/angles/game.asp

   - http://www.fruitpicker.co.uk/activity/
2.6 Processing of outputs in group work

**Suggestion:** Let them post their work for everyone to see. If groups have similar answers, you may decide (or let the class decide) only one or two groups to discuss their answers to questions in Ponder Time. If there are groups with different answers, let the class discuss these answers. Note that a good teacher facilitator minimizes unexpected answers by giving technical assistance to every group before posting outputs.

Your facilitating role is crucial so that students are able to achieve the goal in this section to develop, verify, and prove all six theorems of inequalities in triangles and to continue to unlock triangles in their concept museum.

---

**What to Process**

Your first goal in this section is to develop and verify the theorems on inequalities in triangles. To succeed, you need to perform all the activities that require investigation.

When you make **mathematical generalizations** from your observations, you are actually making **conjectures** just like what mathematicians do. Hence, consider yourself **little mathematicians** as you perform the activities.

Once you have developed these theorems, your third goal is to prove these theorems. You have to provide statements and/or reasons behind statements used to deductively prove the theorems.

The competence you gain in writing proofs enables you to justify inequalities in triangles and in triangular features evident in the things around us.

Before you go through the process, take a few minutes to review and master again the knowledge and skills learned in previous geometry lessons. The concepts and skills on the following topics will help you succeed in the investigatory and proof-writing.
Notes to the Teacher

For the review of all the pre-requisite concepts of the lesson on inequality of triangles, you may decide to present it in a creative manner like making sets of flashcards for each of the following:
Set 1: Axioms of Equality
Set 2: Properties of Equality
Set 3: Definitions, Postulates, and Theorems on Points, Lines, Angles, and Angle Pairs
Set 4: Definitions and Theorems on Triangles
Set 5: Definitions and Postulates on Triangle Congruence
Set 6: Properties of Inequality

Sample Flash Card (Front and Back):

- If points $P$, $Q$ and $R$ are collinear and $Q$ is the midpoint of $PR$, then $PQ \cong QR$
- Definition of a Midpoint

You may also assign each group of students to prepare a specific set of flash cards using used folders. You may then have a quiz bee for six representatives of a group using the flash cards. If a competitor is the first one to name the axiom, property, definition, theorem or postulate flashed, he then can make a step forward until he/she who reaches the front of the classroom is declared as winner. Another set of representatives is called until everyone has mastered all the axioms, properties, definitions, theorems, and postulates.

Include in your discussion Capt. Joseph Huddard—the inventor of the first advanced protractor. In that connection, invite them to visit presented website links about protractors and those that have interactive activities and games that enable them to master the skill in estimating measures of angles and knowledge of triangle congruence postulates. In this manner, their internet visits would be more educational. Follow up on their Internet activity by asking them to share their insights about learning mathematics online.

### Internet Learning
Mastering the Triangle Congruence Postulates

- [http://nlvm.usu.edu/](http://nlvm.usu.edu/)
- [emathtutor.com/G/1_5_Prov](http://emathtutor.com/G/1_5_Prov)
- [http://www.onlinemathlearn.com/geometry-congruence/congruent_angle_pairs.html](http://www.onlinemathlearn.com/geometry-congruence/congruent_angle_pairs.html)
- [http://www.onlinemathlearn.com/geometry-congruence/aspid_165_g_1_t_3.html](http://www.onlinemathlearn.com/geometry-congruence/aspid_165_g_1_t_3.html)

### 6. Definition and Postulates on Triangle Congruence

#### 6.1 Definition of Congruent Triangles: Corresponding parts of congruent triangles are congruent (CPCTC).

#### 6.2 Included Angle
- Included angle is the angle formed by two distinct sides of a triangle.
  - $\angle YES$ is the included angle of $\overline{FY}$ and $\overline{FS}$
  - $\angle EYS$ is the included angle of $\overline{YE}$ and $\overline{YS}$
  - $\angle S$ is the included angle of $\overline{SE}$ and $\overline{SY}$

#### 6.3 Included Side
- Included side is the side common to two angles of a triangle.
  - $\overline{AEW}$ is the included side of $\angle WAE$ and $\angle EWA$
  - $\overline{EW}$ is the included side of $\angle AEW$ and $\angle AWE$
  - $\overline{AE}$ is the included side of $\angle WAE$ and $\angle AEW$

#### 6.4 SSS Triangle Congruence Postulate

#### 6.5 SAS Triangle Congruence Postulate

#### 6.6 ASA Triangle Congruence Postulate

### 7. Properties of Inequality

#### 7.1 For all real numbers $p$ and $q$ where $p > 0$, $q > 0$:
- If $p > q$, then $q < p$.
- If $p < q$, then $q > p$.

#### 7.2 For all real numbers $p$, $q$, $r$ and $s$, if $p > q$ and $r \geq s$, then $p + r > q + s$.

#### 7.3 For all real numbers $p$, $q$ and $r$, if $p > q$ and $r > 0$, then $pr > qr$.

#### 7.4 For all real numbers $p$, $q$ and $r$, if $p > q$ and $q > r$, then $p > r$.

#### 7.5 For all real numbers $p$, $q$ and $r$, if $p = q + r$, and $r > 0$, then $p > q$.

The last property of inequality is used in geometry such as follows:

- $Q$ is between $P$ and $R$.
  - $\overline{PR} \neq \overline{PQ} + \overline{QR}$
  - Then $\overline{PR} > \overline{PQ}$ and $\overline{PR} > \overline{QR}$.

- $\angle 1$ and $\angle 2$ are adjacent angles.
  - $\angle PQR > \angle 1$ and $\angle PQR > \angle 2$
8. How to Combine Inequalities

- Example: How do you write $x < 5$ and $x > -3$ as a combined inequality?

From the number line, we observe that the value of $x$ must be a value between -3 and 5, that is, $x$ is greater than -3 but less than 5. In symbols, $-3 < x < 5$.

9. Equality and Congruence

Congruent figures (segments and angles) have equal measures such that:

- If $\overline{PR} \cong \overline{PR}$, then $PR = PR$.
- If $\angle PQS \cong \angle PQS$, then $m\angle PQS = m\angle PQS$.

Note that to make proofs brief and concise, we may opt to use $\overline{PR} \cong \overline{PR}$ or $\angle PQS \cong \angle PQS$ instead of $PR = PR$ or $m\angle PQS = m\angle PQS$. Because the relation symbol used is for congruence; instead of writing, say, reflexive property of equality as reason; we just have to write, reflexive property. Note that some other books sometimes call reflexive property as reflexivity.

10. How to Write Proofs

Proofs in geometry can be written in paragraph or two-column form. A proof in paragraph form is only a two-column proof written in sentences. Some steps can be left out when paragraph form is used so that two-column form is more detailed.

A combination of both can also be used in proofs. The first part can be in paragraph form especially when the plan for proof is to add some constructions first in the illustration. Proving theorems sometimes requires constructions to be made.

The first column of a two-column proof is where you write down systematically every step you go through to get to the conclusion in the form of a statement. The corresponding reason behind each step is written on the second column.

Possible reasons are as follows: Given, by construction, axioms of equality, properties of equality, properties of inequality, definitions, postulates or previously proven theorems.
Activity No.4: What if It’s Longer?

For Activity No. 4, make sure that each student has his/her own protractor. Ask them to define precision, accuracy, and tolerance using their own words. Discuss the meaning of these words related to making measurements by giving Donna Roberts’s definitions:

The precision of a measuring instrument is determined by the smallest unit to which it can measure. The precision is said to be the same as the smallest fractional or decimal division on the scale of the measuring instrument.

Ask the students: What is the precise unit of a ruler? Answer should be millimeter.

Accuracy is a measure of how close the result of the measurement comes to the “true”, “actual”, or “accepted” value. Accuracy answers this question: How close is your answer to the accepted value?

Tolerance is the greatest range of variations in measurements that can be allowed. Tolerance addresses this question: How much error in the answer is acceptable?

Proceed by discussing that it is expected that the measurements they get from measuring the same lengths vary. Explain that their answers are not wrong. Their answers vary because a measurement made with a measuring device is approximate, not exact. Discussion of the Greatest Possible Error and Tolerance Interval should follow.

Note that you and your class may decide on a tolerance interval. For the example given in the learning guide, you may decide to

The following steps have to be observed in writing proofs:

• Draw the figure described in the problem. The figure may already be drawn for you, or you may have to draw it yourself.
• Label your drawn figure with the information from the given by
  ✓ marking congruent or unequal angles or sides,
  ✓ marking perpendicular, parallel or intersecting lines or
  ✓ indicating measures of angles and/or sides

The markings and the measures guide you on how to proceed with the proof and it also directs you whether your plan for proof requires you to make additional constructions in the figure.

• Write down the steps carefully, without skipping even the simplest one. Some of the first steps are often the given statements (but not always), and the last step is the statement that you set out to prove.

11. How to Write an Indirect Proof

11.1 Assume that the statement to be proven is not true by negating it.
11.2 Reason out logically until you reach a contradiction of a known fact.
11.3 Point out that your assumption must be false, thus, the statement to be proven must be true.

12. Greatest Possible Error and Tolerance Interval in Measurements

You may be surprised why two people measuring the same angle or length may give different measurements. Variations in measurements happen because measurement with a measuring device, according to Donna Roberts (2012), is approximate. This variation is called uncertainty or error in measurement, but not a mistake. She added that there are ways of expressing error of measurement. Two are the following:

Greatest Possible Error (GPE)
One half of the measuring unit used is the greatest possible error. For example, you measure a length to be 5.3 cm. This measurement is to the nearest tenth. Hence, the GPE should be one half of 0.1 which is equal to 0.05. This means that your measurement may have an error of 0.05 cm, that is, it could be 0.05 longer or shorter.

Tolerance Intervals
Tolerance interval (margin of error) may represent error in measurement. This interval is a range of measurements that will be tolerated or accepted before they are considered flawed.

Supposing that a teacher measures a certain angle \( x \) as 36 degrees. The measurement is to the nearest degree, that is, 1. The GPE is one half of 1, that is, 0.5. Your answer should be within this range: 36-0.5 ≤ \( x \) ≤ 36 + 0.5. Therefore, the tolerance interval or margin of error is 35.5 ≤ \( x \) ≤ 36.5.
Now that you have already reviewed concepts and skills previously learned that are useful in this module, let us proceed to the main focus of this section—develop, verify, and prove the theorems on inequalities in triangles.

**Activity 4: WHAT IF IT'S LONGER?**

**Materials Needed:** protractor, manila paper, ruler

**Procedures:**
1. Replicate the activity table on a piece of manila paper.
2. Measure using a protractor the angles opposite the sides with given lengths. Indicate the measure in your table.
3. Discover the relationship that exists between the lengths of the sides of triangles and the angles opposite them and write them on your piece of manila paper.

<table>
<thead>

Once all questions are answered, let the students answer Quiz No. 1. Be sure to explain fully and carefully answers to each item in order to strengthen their understanding of the topic. For the questions under each item in Enrichment, you may let them answer by group. Give it as an assignment to give the students time to think. Follow this procedure in unlocking the answers to all quizzes in this module.

**Answer Key to Activity No.4**

1. Yes, there is.
2. When one side of a triangle is longer than a second side, the angle opposite the first side is larger than the angle opposite the second side.
3. If one side of a triangle is longer than a second side, then the angle opposite the first side is larger than the angle opposite the second side.
4. If one side of a triangle is the longest, then the angle opposite it is the largest.
5. If one side of a triangle is the shortest, then the angle opposite it is the smallest.
6. **Note:** Because of GPE and Tolerance Interval, it is your task to give the measure of the sides as accurately as you can.
Mathematics in the Kitchen: The Kitchen Triangle

1. The Kitchen Triangle was developed in the 1950s as a tool to aid designers in creating an effective kitchen layout. The triangle has a corner at the sink, the refrigerator, and the stove, the three essential locations in the kitchen when cooking. Most kitchen plans still include this today. The idea is to have them close enough that they can easily be moved between, but not too far away to reduce the amount of movement while cooking. The general rule is that the triangle’s perimeter must be at least 12 ft., but should be larger than 26 ft. The area inside the triangle should be completely open, making movement between each of these easy. Most modern kitchen plans still include this.

See the whole article at http://bathroomphotogallery.com/kitchen-plans.php~

Questions:
1. Suppose R is for Refrigerator, S is for Sink, and C for cooking stove, describe the relationship of the sides and angles of the kitchen triangle in each of the models.
2. If you were to build a house in the future, which kitchen model do you prefer from the figure? Why?

Quiz No. 1

Directions: Write your answer on a separate answer sheet.

A. Name the smallest angle and the largest angle of the following triangles:

<table>
<thead>
<tr>
<th>Triangle</th>
<th>Largest Angle</th>
<th>Smallest Angle</th>

</tbody>
</table>

C. Your parents support you in your studies. One day, they find out that your topic in Grade 8 Math is on *Inequalities in Triangles*. To assist you, they attach a triangular dart board on the wall with lengths of the sides given.

They say they will grant you three wishes if you can hit with an arrow the corner with the smallest region and two wishes if you can hit the corner with the largest region.

- Which region should you hit so your parents will grant you three wishes?
- Which region should you hit so your parents will grant you two wishes?

### Teacher's Note and Reminders

**Challenge:**
1. Which figure is drawn first in the artworks—the smallest polygon or the largest polygon?
2. Make your own design by changing the positions or the lengths of the sides of the triangles involved in constructing the figure.
3. Would you like to try using the hexagon?

Visit this web link to see the artworks shown: [http://diannajessie.wordpress.com/tag/triangular-design/](http://diannajessie.wordpress.com/tag/triangular-design/)
Activity No.5:
What if It’s Larger?

For Activity No. 5, start up the class by having a review of the different kinds of triangles according to sides and angles. Proceed by asking what triangles are shown in the activity What if it’s Larger.

Discuss the GPE and the tolerance interval of measurements. Once these are established, let the groups proceed with the activity. Let them post their outputs, process their outputs; and their answers to the questions in ponder time. The answers to numbers 3, 4, and 5 should be written on cartolina and posted in a display board for math concepts.

After discussion, let them answer Quiz No. 1.

Answer Key to Activity No.5

1. Yes, there is.
2. When one angle of a triangle is larger than a second angle, the side opposite the first angle is longer than the side opposite the second angle.
3. If one angle of a triangle is larger than a second angle, then the side opposite the first angle is longer than the side opposite the second angle.
4. If one angle of a triangle is the largest, then the side opposite it is the longest.
5. If one angle of a triangle is the smallest, then the side opposite it is the shortest.
6. | Name of Triangle | Smallest Angle | Smaller Angle | Largest Angle |

Triangular Design and Artworks

1. Answers Vary
2. Possible Answers:
   - Triangular Petal Card because it is easy to perform
   - Triangular Card Stand for those who likes wood working
   - Triangular Girl for those who love sketching and drawing
   - Diminishing Triangles for those who love tiling works.

Activity No.6:
When Can You Say “ENOUGH”?

Two days before Activity No. 6 will be tackled, assign the groups to prepare pieces of straws with the following lengths in inches: 3, 4, 5, 6, 7, 8, 9, 10, 11, and 12. Let them duplicate the 3- and 5-inch straws. Note: If straws are not available, they may use other objects like broom sticks. Make sure that all groups have the materials on the day the activity is scheduled.

Let the group do the activity and record their findings in the table they transferred on the manila paper. Process their outputs and their answers to the questions. Answers should be written on cartolina and posted on the display board of math concepts.

End the activity by asking this: What insight can you share about the title of the activity? After sharing insights, let them answer Quiz No. 3.

Teacher’s Note and Reminders

Don’t Forget!

Materials Needed: plastic straws, scissors, manila paper, and ruler

Procedure:
1. Cut pieces of straws with the indicated measures in inches. There are three pieces in each set.
2. Replicate the table in this activity on a piece of manila paper.
3. With each set of straws, try to form triangle LMN.
4. Write your findings on your table and your responses to the ponder questions on a piece of manila paper.

Task:
- If you were asked to space sprinklers, which spacing would you use?
- To read more about spacing sprinklers, visit this website link: http://www.igationrepair.com/how_to_space_rotors_sprays.html

A. Square Spacing
   Square spacing is the easiest to plot; the downfall is that there will be areas that are going to be covered by all four sprinkler heads causing some over watering. Sprinklers are spaced relatively close when using a square pattern (on average around 25% of the diameter of the throw). This means you will also need more sprinkler heads to cover a given area.

B. Triangular Spacing
   Triangular spacing is plotted using three points which means that more surface area is watered with less overlap. Since you can cover more surface using triangular spacing you will be able to space the sprinkler heads farther apart usually around 65% of the diameter of the throw. Using a triangular pattern in planting sprinkler heads can save money because less sprinkler heads are needed to irrigate any given area.

C. Skye buys a triangular scarf with angle measures as described in the figure shown. She wishes to put a lace around the edges. Which edge requires the longest length of lace?
1. Making Conjectures:

1.1 What pattern did you observe when you compared the sum of the lengths of the two shorter straws with the length of the longest straw? Write your findings by completing the phrases below:

• If the sum of the lengths of the two shorter straws is **EQUAL** to the length of the longest side, a triangle cannot be formed.
• If the sum of the lengths of the two shorter straws is **LESS THAN** the length of the longest side, a triangle **CANNOT** be formed.
• If the sum of the lengths of the two shorter straws is **GREATER THAN** the length of the longest side, a triangle **CAN** be formed.

1.2 When the straws form a triangle, the sum of the lengths of any two straws is greater than the third straw.
• When the straws do not form a triangle, the sum of the lengths of any two straws is less than or equal to the third straw.

2. Triangle Inequality Theorem 3
• The sum of the lengths of any two sides of a triangle is greater than the third side.
• When the straws do not form a triangle, the sum of the lengths of any two straws __________.

2. Your findings in this activity describe Triangle Inequality Theorem 3. State the theorem by describing the relationship that exists between the lengths of any two sides and the third side of a triangle.
• The sum of the lengths of any two sides of a triangle is ____________________.

QUIZ No. 3
Directions: Write your answer on a separate answer sheet.

1. Describe sides $\overline{AW}$, $\overline{EW}$ and $\overline{AE}$ of $\triangle AWE$ using Triangle Inequality Theorem 3.

2. Your task is to check whether it is possible to form a triangle with lengths 8, 10, and 14. Perform the task by accomplishing the table shown. Let the hints guide you.

<table>
<thead>
<tr>
<th>Hints</th>
<th>In Symbols</th>
<th>Simplified Form</th>
<th>Is the simplified form true?</th>
<th>Can a triangle be formed?</th>
<th>Justify</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Is the sum of 8 and 10 greater than 14?</td>
<td>$8 + 10 &gt; 14$</td>
<td>$18 &gt; 14$</td>
<td>YES</td>
<td>YES because the sum of any two sides is greater than the third side.</td>
</tr>
<tr>
<td>2</td>
<td>Is the sum of 8 and 14 greater than 10?</td>
<td>$8 + 14 &gt; 10$</td>
<td>$22 &gt; 10$</td>
<td>YES</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Is the sum of 10 and 14 greater than 8?</td>
<td>$10 + 14 &gt; 8$</td>
<td>$24 &gt; 8$</td>
<td>YES</td>
<td></td>
</tr>
</tbody>
</table>

Which question should be enough to find out if a triangle can be formed?
• The question asking whether $8 + 10 > 14$ should be enough to find out if triangle is formed from the sides because 8 and 10 are the shorter sides.

3. Find out if:

<table>
<thead>
<tr>
<th>Simplified Forms</th>
<th>Is the simplified form true?</th>
<th>Can a triangle be formed?</th>
<th>Justify</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 $5 + 8 &gt; 13$</td>
<td>$13 &gt; 13$</td>
<td>NO</td>
<td></td>
</tr>
<tr>
<td>2 $5 + 13 &gt; 8$</td>
<td>$18 &gt; 8$</td>
<td>YES</td>
<td>YES because the sum of any two sides is greater than the third side.</td>
</tr>
<tr>
<td>3 $8 + 13 &gt; 5$</td>
<td>$21 &gt; 5$</td>
<td>YES</td>
<td></td>
</tr>
</tbody>
</table>

Which question should be enough to find out if a triangle can be formed?
• The question asking whether $8 + 10 > 14$ should be enough to find out if triangle is formed from the sides because 8 and 10 are the shorter sides.

3. Is it possible to form a triangle with sides of lengths 5, 8, and 13? Complete the table to find out the answer.

<table>
<thead>
<tr>
<th>Simplified Forms</th>
<th>Is the simplified form true?</th>
<th>Can a triangle be formed?</th>
<th>Justify</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 $5 + 8 &gt; 13$</td>
<td>$13 &gt; 13$</td>
<td>NO</td>
<td></td>
</tr>
<tr>
<td>2 $5 + 13 &gt; 8$</td>
<td>$18 &gt; 8$</td>
<td>YES</td>
<td></td>
</tr>
<tr>
<td>3 $8 + 13 &gt; 5$</td>
<td>$21 &gt; 5$</td>
<td>YES</td>
<td></td>
</tr>
</tbody>
</table>

Which question should be enough to find out if a triangle can be formed?
4. Can you form a triangle from sticks of lengths 7, 9, and 20?

<table>
<thead>
<tr>
<th>Find out if:</th>
<th>Simplified Forms</th>
<th>Is the simplified form true?</th>
<th>Can a triangle be formed?</th>
<th>Justify</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>7 + 9 &gt; 20</td>
<td>16 &gt; 20</td>
<td>16 &gt; 20</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>7 + 20 &gt; 9</td>
<td>27 &gt; 9</td>
<td>27 &gt; 9</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>9 + 20 &gt; 7</td>
<td>29 &gt; 7</td>
<td>29 &gt; 7</td>
<td></td>
</tr>
</tbody>
</table>

Which question should be enough to find out if a triangle can be formed?

- The question asking whether 7+9>20 should be enough to find out if a triangle is formed from the sides because 7 and 9 are the shorter sides.

5. Study the figure shown and complete the table of inequalities using Triangle Inequality Theorem 3.

<table>
<thead>
<tr>
<th></th>
<th>CA + AR &gt; CR</th>
<th>ER + AR &gt; AE</th>
</tr>
</thead>
<tbody>
<tr>
<td>CA + CE &gt; AE</td>
<td></td>
<td></td>
</tr>
<tr>
<td>AC + CE &gt; AE</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

6. \[ s_1 + s_2 > s_3 \]

7. If \( t \) is the third side then, the following should be satisfied:

\[ 7 + 10 > t \quad 7 + t > 10 \quad t + 10 > 7 \]
\[ t < 7 + 10 \quad t < 10 - 7 \quad t < 7 - 10 \]
\[ t < 17 \quad t < 3 \quad t < -3 \]

But length should be greater than zero. The values described must be excluded.

- Therefore, side \( t \) may have the following measurements in ft.: \{4, 5, 6,...14, 15, 16\}
- Side \( t \) has lengths between 3 ft and 17 ft.

8. Xylie’s estimation, 180 meters, is feasible. The distance of 180 is within the range of \((120 - 80 = 40)\) and \((120 + 80 = 200)\).

9. Because \( S_1 < 80 < 120 < 80 \), then \( 40 < S_1 < 80 \)

10. Path No. 2: School to Church. Justification: Triangle Inequality Theorem 3

11. Errors:
- With two marks on \( \overline{EF} \), it is the longer side so the angle opposite it must also be the larger angle. However, it is opposite the shortest angle—angle \( D \).
Mathematics in Geography: Feasible Possible Distance

From the map, it is clear that the distance \( d \) of Guiuan to Masbate is the longest. Hence, the distance of Guiuan to Masbate must be greater than 265 m but less than the sum of 159 and 265 m, which is 424 m. Therefore, \( 265 < d < 424 \).

1. Architect Szczesny used a triangular design because it is enough for him to provide a bedroom, a bathroom, and a kitchen.
2. Possible reasons:
   - Unlike a rectangular design, a triangular design has the roof already steep so rainwater or snow will just slide easily.
   - With a rectangular design, it needs two stands as foundations to achieve balance. In that case, where will he place the ladder to the house?

Mathematics in Art: Color Triangle

1. Color combinations
   - Yellow and Blue = Green
   - Red and Yellow = Orange
   - Blue and Red = Violet
2. Possible number of exterior angles
   - Two (2)
   - Four (4)
   - Two (2)

Notes to the Teacher

After reviewing their knowledge on exterior angles of triangles, direct their attention to one of the artworks in the activity Artistically Yours. Let them determine the exterior angles and their corresponding remote interior angles.

Activity No. 7: MEASURE Mania: Exterior or Remote Interior?

For Activity no. 7, explain to them that Grade 8 students should have the passion for getting measurements; hence, the title has mania in it (mania for passion). And one has to be sure of his/her measure, hence, MEaSURE.

Tell the students that in this activity, they will find out the inequality that exists between an exterior angle of a triangle and each of its remote interior angles. But before you proceed, decide on the GPE and Tolerance Interval of your measurements.

Let them get the measurement of the exterior and interior angles of the triangles, compare them and write their findings and answers to ponder questions on a piece of manila paper. Process their outputs. You have to consider the GPE and the Tolerance Interval. Their answer to activity question no. 4 should be written on a piece of cartolina and posted on a display board of math concepts.

End the activity with the students answering Quiz No. 4.

Answer key to Activity No. 7 Questions

1. The answer to each item is: >.
2. The answer to each item is: >.
3. The answer to each item is: >.
4. Conjecture: The measure of an exterior angle of a triangle is greater than the measure of either interior angle.

Answer key of Quiz No. 4

1. Inequalities:
   - Considering $\triangle{REA}$: $m\angle{CAR} > m\angle{E}$, $m\angle{CAR} > m\angle{R}$
   - Considering $\triangle{HAM}$: $m\angle{HAT} > m\angle{M}$, $m\angle{HAT} > m\angle{H}$

---

To read more about the coloring triangle, visit this website link:
http://www.atpm.com/9.08/design.shtml

---

MEASURE Mania: Exterior or Remote Interior?

Materials Needed: protractor, manila paper, and ruler

Procedures:
1. Measure the numbered angles of $\triangle{HEY}$, $\triangle{DAY}$, and $\triangle{JOY}$.
2. Replicate the table in this activity on a piece of manila paper.
3. Indicate the measures on your table and write your answers to the ponder questions on a piece of manila paper.

Answers to Activity No. 7 Questions

1. The answer to each item is: >.
2. The answer to each item is: >.
3. The answer to each item is: >.
4. Conjecture: The measure of an exterior angle of a triangle is greater than the measure of either interior angle.

---

Answer key of Quiz No. 4

1. Inequalities:
   - Considering $\triangle{REA}$: $m\angle{CAR} > m\angle{E}$, $m\angle{CAR} > m\angle{R}$
   - Considering $\triangle{HAM}$: $m\angle{HAT} > m\angle{M}$, $m\angle{HAT} > m\angle{H}$
1. Compare the measure of exterior $\angle 1$ with either remote interior $\angle 4$ or $\angle 6$ using the relation symbols $>$, $<$, or $\leq$

- In $\triangle$HEY, $m\angle 1$ is $\text{_____}$ $m\angle 4$.
- In $\triangle$HEY, $m\angle 1$ is $\text{_____}$ $m\angle 6$.
- In $\triangle$DAY, $m\angle 1$ is $\text{_____}$ $m\angle 4$.
- In $\triangle$DAY, $m\angle 1$ is $\text{_____}$ $m\angle 6$.
- In $\triangle$JOY, $m\angle 1$ is $\text{_____}$ $m\angle 4$.
- In $\triangle$JOY, $m\angle 1$ is $\text{_____}$ $m\angle 6$.

2. Compare the measure of exterior $\angle 2$ with either remote interior $\angle 5$ or $\angle 6$ using the relation symbols $>$, $<$, or $\leq$

- In $\triangle$HEY, $m\angle 2$ is $\text{_____}$ $m\angle 5$.
- In $\triangle$HEY, $m\angle 2$ is $\text{_____}$ $m\angle 6$.
- In $\triangle$DAY, $m\angle 2$ is $\text{_____}$ $m\angle 5$.
- In $\triangle$DAY, $m\angle 2$ is $\text{_____}$ $m\angle 6$.
- In $\triangle$JOY, $m\angle 2$ is $\text{_____}$ $m\angle 5$.
- In $\triangle$JOY, $m\angle 2$ is $\text{_____}$ $m\angle 6$.

3. Compare the measure of exterior $\angle 3$ with either remote interior $\angle 4$ or $\angle 5$ using the relation symbols $>$, $<$, or $\leq$

- In $\triangle$HEY, $m\angle 3$ is $\text{_____}$ $m\angle 4$.
- In $\triangle$HEY, $m\angle 3$ is $\text{_____}$ $m\angle 5$.
- In $\triangle$DAY, $m\angle 3$ is $\text{_____}$ $m\angle 4$.
- In $\triangle$DAY, $m\angle 3$ is $\text{_____}$ $m\angle 5$.
- In $\triangle$JOY, $m\angle 3$ is $\text{_____}$ $m\angle 4$.
- In $\triangle$JOY, $m\angle 3$ is $\text{_____}$ $m\angle 5$.

4. **Making Conjecture:** Your comparison between the measure of an exterior angle of a triangle and either interior angle in this activity describes the Exterior Angle Inequality Theorem. With the pattern that you observed, state the exterior angle inequality theorem.

- The measure of an exterior angle of a triangle is $\text{______}$.

**Teacher's Note and Reminders**

**DON'T FORGET**
Mathematics in Psychology: Robert Sternberg’s Triangular Theory of Love

1. Possible Answer:
   • At the angles of the triangles are the Liking (intimacy), Infatuation (passion), and Empty Love (Commitment).
   • The sides are made up of Romantic Love, Companionate Love, and Fatuous Love. Romantic love is a result of passion and intimacy. Companionate love is a result of intimacy and commitment. Fatuous Love is a result of passion and commitment.
   • Consummate Love is at the interior of the triangle and it is a result of passion, intimacy, and commitment.

2. Possible Answer: All are important. However, the most important is commitment because love based on commitment will survive amidst challenges like illness and poverty.

3. Possible Answer: Consummate love because it has all the elements that every human being dreams of.

4. Possible Answers:
   • Consummate love > companionate love > fatuous love > romantic love
   • Commitment > intimacy > passion

Activity No. 8: My Grandpa, My Model of a Healthy Lifestyle

A day before the Activity No. 8 is scheduled to be performed, reproduce the desired number of copies of the Grandpa pictures and the pictures of the suggested outputs of the activity. Note that answers may vary so analyze the merit of students’ outputs carefully.
Possible Answers to Activity 8:

1. Any part of the body can't be cropped.
2. For the standing grandpa, the line on his back, and for the sitting one, his outstretched legs or the line from the tip of his foot to his head.

Activity No. 9: Clock Wisdom: Pretty One!

For Activity no. 9, it is advisable for you to bring a real clock. You have to show to them the angles formed by the short and long hands at 1PM, 2 PM, 3PM and 4PM.

You have to elicit from the class the measures of the angles formed by the hands of the clock at the aforementioned times. Let the students determine the angle by giving them these clues:

- One complete revolution is 360 degrees
- The whole revolution is subdivided into 12 hours

They must realize that each subdivision is (360/12) degrees or 30 degrees. Once the measures of the angles of clock faces A, B, C, and D are determined, let the groups do the activity and answer questions in Ponder Time. Let them post their outputs written on manila paper. Process their outputs. Answers to question no. 6 and 7 (including the drawings of $\triangle CAT$ and $\triangle DOG$) of ponder time must be written on a piece of cartolina and posted on a display board of math concepts.

Activity No. 9 Clock Wisdom: Pretty One!

A complete revolution around a point is equivalent to 360°. The minute and hour hands of the clock also cover that in a complete revolution.

Materials: ruler and manila paper

Procedure:

1. Replicate the activity table on a piece of manila paper.
2. Study the faces of the clock shown at different hours one afternoon and complete your copy of the activity table.
Answer Key to Questions in Activity 9

1. The short hands of the clock in clock faces A, B, C, and D are equal (=).
2. The short hands of the clock in clock faces A, B, C, and D are equal (=).
3. The angles formed by the hands of the clock are called as included angles.
4. The later in the afternoon the hour is, the larger is the angle.
5. The measure of the distance between the tips of the hands of the clock is influenced by the measure of the included angle at a certain time.
6. If two sides of one triangle are congruent to two sides of another triangle, but the included angle of the first triangle is greater than the included angle of the second, then the third side of the first triangle is longer than the third side of the second triangle.
7. If AC ≅ OD, AT ≅ OG, and m∠A > m∠O; then CT > DG
8. Note: Answers may vary.
9. Some examples: Ladies’ fan, door hinge, tail of a peacock, geometric compass, puller, nipper, pliers, pages of a book, arms with the elbow joint as the hinge, legs with knee joint as the hinge, etc.

Activity No. 10:
Roof-y Facts, Yeah!

Before starting group Activity 10, decide for the GPE and Tolerance Interval of the measurements. Proceed to the following: groups working on the activity and answering activity questions while you roam around to give technical assistance; posting of outputs; processing outputs; and writing answers of nos. 3 and 4 (including the drawings ∆RAP and ∆YES) on a piece of cartolina to be posted on the display board in mathematics.

Let the class answer Quiz No. 5 and discuss the solutions and answers for each item.

1. Write your observations on the following:
   • The lengths of the roofs at the left part of both houses __.
   • The lengths of the roofs at the right part of both houses __.
   • The lengths of the roof bases of both houses __.
   • The Roof angles of both houses __.
2. What influences the measures of the roof angles of both houses? Justify.
3. Making a Conjecture: Your findings describe the Converse of Hinge Theorem (This is otherwise known as SSS Triangle Inequality Theorem). How will you state this theorem if you consider the two corresponding roof lengths as two sides of two triangles, the roof bases as their third sides, and the roof angles as included angles? State it in if-then form.
   If two sides of one triangle are congruent to two sides of another triangle, but the third side of the first triangle is greater than the third side of the second, then __.
4. Using the Converse of Hinge Theorem, write an if-then statement to describe the appropriate sides and angles of ∆RAP and ∆YES.
5. With both houses having equal roof lengths, what conclusion can you make about their roof costs?
Answer Key to Questions in Activity 10

1. Observations:
   • The lengths of the roofs at the left part of both houses are equal.
   • The lengths of the roofs at the right part of both houses are equal.
   • The lengths of the roof bases of both houses differ in lengths. Roof base of house A is shorter than the roof base of House B.
2. The measures of roof angles are affected by the length of the roof bases.
   If the roof base is longer, the roof angle is also larger.
3. If two sides of one triangle are congruent to two sides of another triangle, but the third side of the first triangle is longer than the third side of the second, then the included angle of the first triangle is larger than the included angle of the second triangle.
4. If $AR \cong EY$, $AP \cong ES$, and $PR > SY$; then $m\angle A > m\angle E$.
5. Roof costs for House A is the same as roof costs for House B.

Teacher's Note and Reminders

Materials Needed: protractor, manila paper, and ruler
Procedure: Study the house models and complete your copy of the activity table. For ponder questions, write your answers on a piece of manila paper.

<table>

**C.**

1. $AC > DF$
2. $HI > GI$
3. $m \angle RAT > m \angle YAT$
4. $m \angle FAE = m \angle MAE$

**D.**

2$m - 1 > m + 4$. Therefore, $m > 5$.

**E.**

Sample Answer:

The hinge of the compass makes it possible to adjust the distance between the tips of the compass point and the pencil point. Adjustments determine the desired lengths of radii for circles to be drawn.
C. Using Hinge Theorem and its converse, write a conclusion about each figure.

1. 

2. 

3. 

4. 

D. Using Hinge Theorem and its converse, solve for the possible values of $m$.

\[ m + 4 \]
\[ 2m - 1 \]

E. Mathematics in Fashion: Ladies’ Fan

1. It is important when it is hot and there is no air conditioning unit like in churches.
2. When the fan is not opened completely, the distance between the tips of the side frame of the fan is shorter than when the fan is opened completely.

From the prior investigations, we have discovered the following theorems on triangle inequalities:

**Inequalities in One Triangle:**

**Triangle Inequality Theorem 1** ($S_3 \rightarrow A_3$)
If one side of a triangle is longer than a second side, then the angle opposite the first side is larger than the angle opposite the second side.

**Triangle Inequality Theorem 2** ($A_3 \rightarrow S_3$)
If one angle of a triangle is larger than a second angle, then the side opposite the first angle is longer than the side opposite the second angle.

**Triangle Inequality Theorem 3** ($S_1 + S_2 > S_3$)
The sum of the lengths of any two sides of a triangle is greater than the length of the third side.

**Exterior Angle Inequality Theorem**
The measure of an exterior angle of a triangle is greater than the measure of either remote interior angle

**Inequalities in Two Triangles:**

**Hinge Theorem or SAS Inequality Theorem**
If two sides of one triangle are congruent to two sides of another triangle, but the included angle of the first triangle is greater than the included angle of the second, then the third side of the first triangle is longer than the third side of the second.

**Converse of Hinge Theorem or SSS Inequality Theorem**
If two sides of one triangle are congruent to two sides of another triangle, but the third side of the first triangle is longer than the third side of the second, then the included angle of the first triangle is larger than the included angle of the second.

E. Enrichment Activities

1. **Hinges in Tools and Devices**
Hinges are used to fasten two things together and allow adjustment, rotation, twisting or pivoting. Choose at least one of the following hinged devices and explain how it works.
How can we prove these theorems?

Writing proofs is an important skill that you will learn in geometry. It will develop your observation skills, deductive thinking, logical reasoning, and mathematical communication. Guide questions are provided to help you succeed in the next activities.

In writing proofs, you have to determine the appropriate statements and give reasons behind these statements. There are cases when you only have to complete a statement or a reason. Make use of hints to aid you in your thinking.

Be reminded that theorems may be proven in different ways. The proofs that follow are some examples of how these theorems are to be proven.

For activity 11-16, you are required to use a piece of manila paper for each proof.

Make sure that a day before the activities in writing proofs are scheduled, groups already have enough number of pieces of manila paper for the activity where tables for statements and reasons are already prepared.

You may opt to let the students prepare metastrips (each piece is 1/3 of bond paper cut lengthwise) and pentel pen or ball pen so that they only have to write each statement or reason on a metastrip and attach it on the appropriate row and column.

Your technical assistance is crucial in the proof-writing activities so roam around purposely. Most of your assistance involves your directing them to refer the review points in this module.

Questions:
1. Do you think that fan is an important fashion item?
2. Describe the concept of inequality in triangles that is evident about a ladies’ fan.

From the prior investigations, we have discovered the following theorems on triangle inequalities:

**Inequalities in One Triangle:**

Triangle Inequality Theorem 1 ($S_s \rightarrow A_a$)

If one side of a triangle is longer than a second side, then the angle opposite the first side is larger than the angle opposite the second side.

Triangle Inequality Theorem 2 ($A_a \rightarrow S_s$)

If one angle of a triangle is larger than a second angle, then the side opposite the first angle is longer than the side opposite the second angle.

Triangle Inequality Theorem 3 ($S_1 + S_2 > S_3$)

The sum of the lengths of any two sides of a triangle is greater than the length of the third side.

Exterior Angle Inequality Theorem

The measure of an exterior angle of a triangle is greater than the measure of either remote interior angle

**Inequalities in Two Triangles:**

Hinge Theorem or SAS Inequality Theorem

If two sides of one triangle are congruent to two sides of another triangle, but the included angle of the first triangle is greater than the included angle of the second, then the third side of the first triangle is longer than the third side of the second.

Converse of Hinge Theorem or SSS Inequality Theorem:

If two sides of one triangle are congruent to two sides of another triangle, but the third side of the first triangle is longer than the third side of the second, then the included angle of the first triangle is larger than the included angle of the second.

2. **Mathematics in Fashion: Ladies’ Fan**

From the sixteenth century up to the late 1800s throughout the whole of Europe, each fashionable lady had a fan and because of its prominence, it was considered as a “woman’s scepter”—tool for communicating her thoughts.

How can we prove these theorems?

Writing proofs is an important skill that you will learn in geometry. It will develop your observation skills, deductive thinking, logical reasoning, and mathematical communication. Guide questions are provided to help you succeed in the next activities.

In writing proofs, you have to determine the appropriate statements and give reasons behind these statements. There are cases when you only have to complete a statement or a reason. Make use of hints to aid you in your thinking.

Be reminded that theorems may be proven in different ways. The proofs that follow are some examples of how these theorems are to be proven.

For activity 11-16, you are required to use a piece of manila paper for each proof.

Activity 11
Proving Triangle Inequality Theorem 1

Triangle Inequality Theorem 1 ($Ss \rightarrow Aa$)
If one side of a triangle is longer than a second side, then the angle opposite the first side is larger than the angle opposite the second side.

Given: $\triangle LMN; LN > LM$
Prove: $\angle LMN > \angle LNM$

Proof: There is a need to make additional constructions to prove that $\angle LMN > \angle LNM$. With compass point on $L$ and with radius $LM$, mark a point $P$ on $LN$ and connect $M$ and $P$ with a segment to form triangle.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Reasons</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. How do you describe the relationship between $LM$ and $LP$?</td>
<td>By construction</td>
</tr>
<tr>
<td>2. Based on statement 1, what kind of a triangle is $\triangle LMP$?</td>
<td>Definition of Isosceles Triangle</td>
</tr>
<tr>
<td>3. Based on statement 1, how do you describe $\angle 1$ and $\angle 2$?</td>
<td>Converse of Isosceles Triangle Theorem</td>
</tr>
</tbody>
</table>
4. Study the illustration and write a statement about \( \angle LMN \) if the reason is the one given.  

5. Basing on statement 4, write an inequality statement focusing on \( \angle 1 \).  

6. Using statement 3 in statement 5: \( \angle LMN > \angle 2 \)  

7. Study the illustration and write an operation statement involving \( \angle MPN, \angle N, \) and \( \angle 3 \)  

8. Study the illustration and write an operation statement involving \( \angle 2 \) and \( \angle MPN \)  

9. \( \angle 2 + \angle MPN = \angle MPN + \angle N + \angle 3 \)  

10. What will be the result if \( \angle MPN \) is deducted away from both sides of statement 9?  

11. Basing on statement 10, write an inequality statement focusing on \( \angle N \).  

12. Based on statement 6 and 11: If \( \angle LMN > \angle 2 \) and \( \angle 2 > \angle N \), then  

---

**Congratulations! You have contributed much in proving Triangle Inequality Theorem 1.** In the next activity, you will see that Triangle Inequality Theorem 1 is used in proving Triangle Inequality Theorem 2.
Indirect Proof of Triangle Inequality Theorem 2

Given: \( \triangle LMN \); \( m\angle L > m\angle N \)
Prove: \( MN > LM \)

Indirect Proof:

Assume: \( MN \not> LM \)

<table>
<thead>
<tr>
<th>Statements</th>
<th>Reasons</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. ( MN \not&gt; LM ) such that ( MN = LM ) or ( MN &lt; LM )</td>
<td>1. Temporary Assumption</td>
</tr>
<tr>
<td>2. Considering ( MN = LM ): If ( MN = LM ), then ( \triangle LMN ) is an isosceles triangle.</td>
<td>2. Definition of isosceles triangles</td>
</tr>
</tbody>
</table>

Consequently, \( \angle L = \angle N \).

The assumption that \( MN = LM \) is false.

The conclusion that \( \angle L \cong \angle N \) contradicts the given that \( m\angle L > m\angle N \).

3. Considering \( MN < LM \): If \( MN < LM \), then \( m\angle L < m\angle N \).

The Assumption that \( MN < LM \) is False

The conclusion that \( m\angle L < m\angle N \) contradicts the known fact that \( m\angle L > m\angle N \).

4. Therefore, \( MN > LM \) must be True

4. The assumption that \( MN \not> LM \) contradicts the known fact that \( m\angle L > m\angle N \).

Teacher's Note and Reminders

**Don't Forget!**

Amazing! You have helped in proving Triangle Inequality Theorem 2. Let us proceed to prove Triangle Inequality Theorem 3 using a combination of paragraph and two-column form. You will notice that Triangle Inequality Theorem 2 is used as reason in proving the next theorem.

Teacher’s Note and Reminders

Don’t Forget!

Activity 13 PROVING TRIANGLE INEQUALITY THEOREM 3

Triangle Inequality Theorem 3 ($S_i + S_j > S_k$)
The sum of the lengths of any two sides of a triangle is greater than the length of the third side.

Given: $\triangle LMN$ where $LM < LN < MN$

Prove: $MN + LN > LM$

Proof:
1. Notice that since $MN > LN$ and that $MN > LM$, then it’s obvious that $MN + LM > LN$ and $MN + LN > LM$ are true.
2. Hence, what remains to be proved is the third statement: $LM + LN > MN$

Let us construct $LP$ as an extension of $LM$ such that $L$ is between $M$ and $P$, $LP \cong LN$ and $\triangle LNP$ is formed.

Teacher's Note and Reminders

Hurray! Triangle Inequality Theorem 3 is already proven. Let us proceed to writing the proof of Exterior Angle Inequality Theorem.

Activity 14 Proving the Exterior Angle Inequality Theorem

Exterior Angle Inequality Theorem
The measure of an exterior angle of a triangle is greater than the measure of either remote interior angle

Given: $\triangle LMN$ with exterior angle $\angle LNP$
Prove: $\angle LNP > \angle MLN$

Proof:
Let us prove that $\angle LNP > \angle MLN$ by constructing the following:
1. midpoint $Q$ on $LN$ such that $LQ \cong NQ$
2. $MR$ through $Q$ such that $MQ \cong QR$
Indeed, the measure of an exterior angle of a triangle is greater than the measure of either remote interior angle.

</tr>
</tbody>
</table>

### Activity 15: PROVING THE HINGE THEOREM

**Hinge Theorem or SAS Triangle Inequality Theorem**

If two sides of one triangle are congruent to two sides of another triangle, but the included angle of the first triangle is greater than the included angle of the second, then the third side of the first triangle is longer than the third side of the second.

**Given:** $\triangle CAN$ and $\triangle LYT$; $CA \equiv LT$, $AN \equiv YT$, $\angle A > \angle Y$

**Prove:** $CN > LT$

---

$\square$
Answer Key to Activity 16: Indirect Proof of the Converse of Hinge Theorem

<table>
<thead>
<tr>
<th>Statements</th>
<th>Reasons</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. ( \angle D \cong \angle U ) or ( \angle D &lt; \angle U )</td>
<td>1. Assumption that ( \angle D \not\cong \angle U )</td>
</tr>
<tr>
<td>2. Considering ( \angle D \cong \angle U ): It's given that ( OD \cong LU ), ( DG \cong UV ). If ( \angle D \cong \angle U ), then ( \triangle ODG \cong \triangle LUV ).</td>
<td>2. SAS Triangle Congruence Postulate</td>
</tr>
<tr>
<td>From the congruence, ( OG \cong LV )</td>
<td>Corresponding parts of congruent triangles are congruent</td>
</tr>
<tr>
<td>The Assumption that ( \angle D \cong \angle U ) is false.</td>
<td>( OG \not\cong LV ) contradicts the given that ( OG &gt; LV )</td>
</tr>
<tr>
<td>3. Considering ( \angle D &lt; \angle U ): If ( \angle D &lt; \angle U ), then ( OG &lt; LV ).</td>
<td>3. SAS Inequality Theorem or Hinge Theorem</td>

<tr>
<td>The assumption that ( \angle D &lt; \angle U ) is false.</td>
<td>( OG &lt; LV ) contradicts the given that ( OG &gt; LV )</td>
</tr>
<tr>
<td>4. Therefore, ( \angle D &gt; \angle U ) must be true.</td>
<td>4. Assumption that ( \angle D \not\cong \angle U ) is proven to be false.</td>
</tr>
</tbody>
</table>

---

**Proof:**

1. Construct \( \triangle AW \) such that:
   - \( AW \cong AN \cong YT \)
   - \( AW \) is between \( AC \) and \( AN \), and
   - \( \angle CAW \cong \angle LYT \).

   Consequently, \( \triangle CAW \cong \triangle LYT \) by SAS Triangle Congruence Postulate. So, \( CW \cong LT \) because corresponding parts of congruent triangles are congruent.

2. Construct the bisector \( \overline{AH} \) of \( \angle NAW \) such that:
   - \( H \) is on \( CN \)
   - \( \angle NAH \cong \angle WAH \)

   Consequently, \( \triangle NAH \cong \triangle WAH \) by SAS Triangle Congruence Postulate because \( AH \cong AH \) by reflexive property of equality and \( \overline{AW} \cong \overline{AN} \) from construction no. 1. So, \( WH \cong HN \) because corresponding parts of congruent triangles are congruent.

---

After proving the theorems on inequalities in triangles, you are now highly equipped with skills in writing both direct and indirect proofs. Moreover, you now have a good grasp on how to write proofs in paragraph and/or two-column form.

You will be undergoing more complex application problems involving inequalities in triangles in the next section.

Dear Concept Contractor, your task is to revisit your concept museum. How many more tasks can you tackle? Which concepts you have built previously need revision? Check also your decisions in Activity No.1. Would you like to change any decision?

**How can you justify inequalities in triangles?** Do you have a new insight on how to address this essential question raised in the activity *Artistically Yours*?

Now that you know the important ideas about this topic, let’s go deeper by moving on to the next section.

---

**Activity 16 INDIRECT PROOF OF THE CONVERSE OF HINGE THEOREM**

**Converse of Hinge Theorem or SSS Triangle Inequality Theorem**

If two sides of one triangle are congruent to two sides of another triangle, but the third side of the first triangle is longer than the third side of the second, then the included angle of the first triangle is larger than the included angle of the second.
After proving the theorems on inequalities in triangles, you are now highly equipped with skills in writing both direct and indirect proofs. Moreover, you now have a good grasp on how to write proofs in paragraph and/or two-column form.

You will be undergoing more complex application problems involving inequalities in triangles in the next section.

Dear Concept Contractor, your task is to revisit your concept museum. How many more tasks can you tackle? Which concepts you have built previously need revision? Check also your decisions in Activity No.1. Would you like to change any decision?

How can you justify inequalities in triangles? Do you have a new insight on how to address this essential question raised in the activity Artistically Yours?

Now that you know the important ideas about this topic, let’s go deeper by moving on to the next section.
What to Understand

Having developed, verified, and proved all the theorems on triangle inequalities in the previous section, your goal now in this section is to take a closer look at some aspects of the topic. This entails you to tackle on more applications of the theorems on triangle inequalities.

Your goal in this section is to use the theorems in identifying unknown inequalities in triangles and in justifying them.

The first set of activities showcases model examples that will equip you with ideas and hints on how to conquer problems of the same kind but already have twists. When it is your turn to answer, you have to provide justifications to every step you take as you solve the problem. The model examples provide questions for you to answer. Your answers are the justifications.

The second set of activities requires you to use the theorems on inequalities in triangles in solving problems that require you to write proofs.

There are no limits to what the human imagination can fathom and marvel. Fun and thrill characterize this section. It is also where you will wrap up all the concepts you learned on Triangle Inequalities.

SHOW ME THE ANGLES!!!

Activity 17

Watch this!

For extra fun, groups of students in a class are tasked to create algebraic expressions to satisfy the measures of the angles of their triangular picture frame project. If the measure of the angles are as follows:

\[ 58 + 2x - 1 + 4x - 3 = 180 \]
\[ 6x + 54 = 180 \]
\[ 6x = 126 \]
\[ x = 21 \]

Since \( \angle A > m \angle E > m \angle S \), then the longest side is opposite \( \angle A \), \( ES \), and the shortest side is opposite \( \angle S \), \( AE \).

### Answer Key to Activity 17: Show Me the Angles!!!

**Answer key to Activity No. 17 Watch-This Questions!**

1. The value of \( x \) is solved first because knowing its value leads to determining the values of the angles of the triangular frame.
2. The sum of the angles is equated to 180 because the sum of the angles of a triangle is always 180 degrees.
3. Triangle Inequality Theorem 2 (\( Aa \rightarrow Ss \))
4. Even without the actual measurements, we are sure that our answer is correct because we have used the theorems we developed, verified and proved.

**Note:** Explain to the students that when we justify our answer using theorems or postulates, we are justifying deductively. So, deductively, it is sure that the answer is correct.

### It’s Your Turn!

\[ m \angle S + m \angle E + m \angle A = 180 \]
\[ 58 + (2x - 1) + (4x - 3) = 180 \]
\[ 6x + 54 = 180 \]
\[ 6x = 126 \]
\[ x = 21 \]

Solution:

\[ m \angle A = 5x - 3 \]
\[ m \angle C = 2x + 5 \]
\[ m \angle E = 3x - 2 \]

Therefore, listing the sides in increasing order should follow this order: Sides opposite \( \angle C \), \( \angle E \), and \( \angle A \). That is, \( AE \), \( AC \), and \( CE \).
**Answer Key to Activity 18:**
**Believe Me, There are Lots of Possibilities!**

1. Triangle Inequality Theorem \(3(S_1 + S_2 > S_3)\)
2. Even without actually drawing all the possible lengths of the third side to form a triangle with known sides 11 and 17, we are convinced that our answer is correct because its basis, Triangle Inequality Theorem 3, is a theorem that we have developed, verified and proved. Deductively, we are convinced that our answer is correct.
3. Relationship: 6 is the difference when 17 is subtracted from 11.
4. Relationship: 28 is the sum of 11 and 17.
5. \(l - s < t < l + s\)
6. There is an infinite number of possible lengths for the third side \(t\).

**Note:** Remind them of their lesson on the set of rational numbers or fractions between 0 and 1 in Grade 7. Because a fraction between 0 and 1 can be in the form \(\frac{1}{M}\), \(M\) can be any value greater than 1. Hence, \(M\) can be 1, 000, 000 or more. Thus, there are infinite fractions between 0 and 1. Notice that this concept is also applicable to lengths between 6 and 28.

**It’s Your Turn!**

The lengths of the sides of a triangle are \(16 - k\), 16 and \(16 + k\). What is the possible range of values of \(k\)?

Using the Triangle Inequality Theorem 3, let us find the range of values for \(k\):

\[
\begin{align*}
16 + (16 + k) &> 16 \quad \text{(16 - k) + 16 > 16 + k} \\
16 + 16 + k &> 16 \quad \text{(16 - k) + 16 > 16 + k} \\
32 + k &> 16 \quad \text{(16 - k) + 16 > 16 + k} \\
k &> -16 \\
-16 &< k
\end{align*}
\]

Writing them as a combined inequality, the answer is \(-16 < k < 8\).

1. Why is the value \(x\) being solved first?
2. Why is the sum of the angles being equated to 180°?
3. What theorem justifies the conclusion that the increasing order of the sides is \(AE\), \(AC\), and \(CE\)?
4. What makes us sure that our answer is correct considering that we have not exactly seen the actual triangle and have not used tools to measure the lengths of its sides and the measures of its angles?

**It’s Your Turn!**

Angle \(S\) of the triangular picture frame of another group is 58°. The rest of the angles have the following measures: \(m\angle E = 2x - 1\), \(m\angle A = 4x - 3\). Determine the longest and the shortest side. Give justifications.

**Activity 18**

**BELIEVE ME, THERE ARE LOTS OF POSSIBILITIES!**

**Watch this!**

**Problem:**
You are tasked to draw a triangle wherein the lengths of two sides are specified. What are the possible lengths for the third side of the triangle you will draw if two sides should be 11 and 17, respectively? How many possible integer lengths has the third side?

**Solution:**
Since the third side is unknown, let’s represent its length by \(t\).

\[
\begin{align*}
11 + 17 > t &\quad \text{Inequality 1} \\
28 > t &\quad \text{Inequality 2} \\
17 + t > 11 &\quad \text{Inequality 3}
\end{align*}
\]

\[
\begin{align*}
11 + t > 17 &\quad t > 17 - 11 \\
28 > t &\quad t > 6 \\
17 + t > 11 &\quad t > 11 - 17
\end{align*}
\]

The resulting inequalities show that \(t\) must be between 6 and 28, that is, 6 as the lower boundary and 28 as the higher boundary. Using combined inequality, the order by which they will be written should be 6, \(t\), then 28.

**Therefore,**
\[
\begin{align*}
\text{the possible lengths for the third side is } 6 < t < 28. \\
\text{the set of possible integer lengths for the third side of the triangle is described as follows: } \{7, 8, 9, \ldots, 27\}. \text{ Hence, there are } 27 - 6 = 21 \text{ possible integer lengths for the third side.}
\end{align*}
\]
1. What theorem justifies the three inequalities being written about the sides?

2. Are you convinced that $6 < t < 28$ is accurate even if you have not tried drawing all the possible lengths of the third side to form a triangle with 11 and 17? Why?

3. Do you observe a relationship existing between 6 in $6 < t < 28$ and the two known lengths 11 and 17? Describe the relationship.

4. Do you observe a relationship existing between 28 in $6 < t < 28$ and the two known lengths 11 and 17? Describe the relationship.

5. If the known lengths are $l$ and $s$, where $l$ is longer and $s$ is shorter, what should be the formula in solving for the unknown third side $t$?

6. There are 21 possible integer lengths for the third side when two respective sides of a triangle have lengths 11 and 17. Can you count all the possible lengths other than the integer lengths? Explain.

**It's Your Turn!**

The lengths of the sides of a triangle are $16 - k$, 16, and $16 + k$. What is the possible range of values of $k$?

Using the Triangle Inequality Theorem 3, let us find the range of values for $k$:

1. 500
2. 350
3. 1300
4. 1450

Therefore, Chloe is farther from the rotunda. Justification is the Hinge Theorem.

**Answer Key to Activity 19:**

**And You Thought Only Surveyors Trace, Huh!**

1. 110 and 70 degrees form a linear pair, also 90 and 90 degrees.

2. Triangle Inequality Theorem 2 ($A \rightarrow S$)

3. Probably yes. However, solving it is easier through a detailed illustration. Solving it mentally would be tedious because there are plenty of information in the problem.

4. Had we not seen the illustration and had we not known about Triangle Inequality Theorem 2, the answer would be that their distance from the centre of the oval is the same because they have travelled the same length from start to where they stop.

5. We are convinced that the conclusion is true because the basis is Triangle Inequality Theorem 2 that we developed, verified and proved to be true. Deductively, we are convinced that the conclusion is true.

**It's Your Turn!**

The lengths of the sides of a triangle are $16 - k$, 16, and $16 + k$. What is the possible range of values of $k$?

Using the Triangle Inequality Theorem 3, let us find the range of values for $k$:

1. 500
2. 350
3. 1300
4. 1450

Therefore, Chloe is farther from the rotunda. Justification is the Hinge Theorem.

**Questions?**

1. What theorem justifies the three inequalities being written about the sides?

2. Are you convinced that $6 < t < 28$ is accurate even if you have not tried drawing all the possible lengths of the third side to form a triangle with 11 and 17? Why?

3. Do you observe a relationship existing between 6 in $6 < t < 28$ and the two known lengths 11 and 17? Describe the relationship.

4. Do you observe a relationship existing between 28 in $6 < t < 28$ and the two known lengths 11 and 17? Describe the relationship.

5. If the known lengths are $l$ and $s$, where $l$ is longer and $s$ is shorter, what should be the formula in solving for the unknown third side $t$?

6. There are 21 possible integer lengths for the third side when two respective sides of a triangle have lengths 11 and 17. Can you count all the possible lengths other than the integer lengths? Explain.

**It's Your Turn!**

**Problem:**

The lengths of the sides of a triangle are $16 - k$, 16, and $16 + k$. What is the range of the possible values of $k$? Create a table of the possible integer lengths of the sides of the triangle. Is $16-k$ always the shortest length? Develop a general formula for lengths with this description. Provide justifications.

**Activity 19 AND YOU THOUGHT ONLY SURVEYORS TRACE, HUH!**

Watch this!

**Problem:**

Kerl and Kyle play with their roller skates at the town oval. From the centre of the oval, Kerl skates 4 meters east and then 5 meters south. Kyle skates 5 meters west. He then takes a right turn of $70^\circ$ and skates 4 meters. Who is farther from the centre of the oval?

**Solution:**

Therefore, Kyle is farther than Kerl from the center of the oval.
2. Enrichment Activity

Career in Mathematics: Air Traffic Controller

Sample Research:

You and a friend are flying separate planes. You leave the airport and fly 120 miles due west. You then change direction and fly W 30° N for 70 miles. (W 30° N indicates a north-west direction that is 30° north of due west.) Your friend leaves the airport and flies 120 miles due east. She then changes direction and flies E 40° S for 70 miles. Each of you has flown 190 miles, but which plane is farther from the airport?

SOLUTION

Begin by drawing a diagram, as shown below. Your flight is represented by ΔPQR and your friend’s flight is represented by ΔPST.

Because these two triangles have two sides that are congruent, you can apply the Hinge Theorem to conclude that RP is longer than TP.

Therefore, your plane is farther from the airport than your friend’s plane.

1. How are 110° and 90° produced?
2. What theorem justifies the conclusion that Kyle is farther than Kerl from the center of the oval?
3. Would this problem be answered without a detailed illustration of the problem situation? Explain.
4. Had the illustration of the problem not been drawn, what would have been your initial answer to what is asked? Explain.
5. We have not actually known Kerl and Kyle’s distances from the center of the oval but it is concluded that Kyle is farther than Kerl. Are you convinced that the conclusion is true? Explain.

It’s Your Turn!

1. Problem:
From a boulevard rotunda, bikers Shielou and Chloe who have uniform biking speed, bike 85 meters each in opposite directions—Shielou, to the north and Chloe, to the south. Shielou took a right turn at an angle of 50° and Chloe, a left turn at 35°. Both continue biking and cover another 60 meters each before taking a rest. Which biker is farther from the rotunda? Provide justifications.

2. Enrichment Activity

Career in Mathematics: Air Traffic Controller

Air traffic controllers coordinate the movement of air traffic to make certain that planes stay a safe distance apart. Their immediate concern is safety, but controllers also must direct planes efficiently to minimize delays.

They must be able to do mental math quickly and accurately. Part of their job is directing aircraft at what altitude and speed to fly.

Task:

Make a research of problems related to the work of air traffic controllers. Solve it and present it in class.
Answer Key to Activity 20:
Trust Yourself, You’re a Geometrician!

1. Side HT is the longest because triangle HIT looks bigger in the figure. **Note:** Explain to the students that the problem says that the diagram is not drawn to scale so answers based on the drawing without considering the given data would be faulty. It is advised that you integrate it with this saying: Do not judge a book by its cover—that outward appearances can be misleading.

2. It is necessary to consider each right triangle individually because a side of one triangle is also a side to another triangle—the triangles have common sides.

3. Triangle Inequality Theorem 2 (\(\text{ASA}\))

4. Deductively, we are convinced that the conclusion is true.

**Answer Key to It’s Your Turn! Problem**

1. Side HT is the longest because triangle HIT looks bigger in the figure can be misleading.

2. It is necessary to

   **Considering \(\triangle MAT\):**
   \(\text{AT}=13, \text{MT}=14, \text{MA}=15\)
   For angles opposite them
   \(\angle M < \angle MAT < \angle T\)

   **Considering \(\triangle MEA\):**
   \(\text{ME}=9, \text{EA}=12, \text{AM}=15\)
   For angles opposite them
   \(\angle 2 < \angle M < \angle 1\)

   **Considering Exterior Angle 1 of \(\triangle TEA\):**
   \(\angle 1 > \angle T \text{ or } \angle T < \angle 1\)

   Therefore, the answer is as follows:
   \(\angle 2 < \angle M < \angle MAT < \angle T < \angle 1\)

3. By just looking at the original figure, which side do you think is the longest? There is a misconception to explain why HT would have been the initial choice as having the longest side. Explain.

4. Why is it necessary to consider each right triangle individually? Explain.

5. What theorem justifies the choice of the longest side in each triangle?

6. Notice that the diagram is not drawn to scale. However, we are still able to tell which side is the longest and which side is the shortest. Are you convinced that your answer is true? Explain.

**It’s Your Turn! Problem**

The diagram is not drawn to scale. Using \(\angle 1, \angle 2, \angle T, \angle M, \text{and } \angle MAT\), complete the combined inequalities below:

\[\_\_\_\_\_ < \_\_\_\_\_ < \_\_\_\_\_ < \_\_\_\_\_ < \_\_\_\_\_\]

**Solution:**

\[\text{Considering } \angle HIT: \quad \text{HT} < \text{HI} \]

\[\text{Considering } \angle HAI: \quad \text{HI} < \text{HA} \]

\[\text{Considering } \angle HFA: \quad \text{HA} < \text{HF} \]

Therefore, the longest side is \(\text{HF}\) and the shortest side is \(\text{HT}\).
**Answer Key to Activity 21:**
**I Believe I can Fly**

1. Sides: coco trunk, distance of the kid from the bottom of the coco trunk, length of the coco leaf stalk.
2. The inequalities that exist are the following:
   - The distance of the kid from the bottom of the coco trunk at different speeds.
   - The angle determined by the coco trunk and the coco leaf stalk at different speeds.
3. Comparison:
   - The distance of the kid from the bottom of the coco trunk is longer when he swings at full speed and shorter when he swings at low speed.
   - The angle determined by the coco trunk and the coco leaf stalk is larger when he swings at full speed and smaller when he swings at low speed.
4. I can justify them deductively using the hinge theorem and its converse.
5. (Answers may vary)
6. Possible answer: Using vines like Tarzan, swing rides in amusement parks.
7. Possible answer: Erecting a post covered with rubber or leather and using big rope for a swing ride.
8. Possible disadvantages: Height of swing towers and lengths of swings would not be proportional and can cause accidents.
9. Possible answers: Efficient (Strong and Stable), Safe, Well-Built, Attractive.
10. Possible answers: Prepare a design to determine the specifications and raw materials; let the best workers make it; have it tested for quality.
11. Yes, so that tools and equipment are efficient, long-lasting, and safe to use.

The figure shows two pictures of a kid swinging away from the coco trunk while holding on to the stalk of coco leaf. Compare the distances of the kid from the bottom of the coco trunk in these pictures. Note that the kid's distance from the bottom of the coco trunk is farthest when he swings at full speed.
### Answer Key to Activity 22:
**You are Now Promoted as PROOFessor!**

1. Write the statements supported by the reasons on the right side of the two-column proof.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Reasons</th>

</tbody>
</table>
In this section, the discussion focuses mainly on using the triangle inequality theorems in solving both real-life problems and problems that require writing proofs.

Considering the application and proof-writing problems found in this module, share your insights on the following questions:

• Can you solve these problems without accurate illustrations and markings on the triangles?
• Can you solve these problems without prior knowledge related to triangles and writing proofs?
• Has your knowledge in algebra helped you in solving the problems?
• Have the theorems on triangle inequalities helped you in writing proofs of theorems?

Having tackled all concepts and skills to be learned on inequalities in triangles, revisit your decisions in Activity No.1 and write your responses to the statements under My Decisions Later. Are there changes to your responses? Explain.

What would be your reply to the essential question “how can you justify inequalities in triangles”?

Now that you have a deeper understanding of the topic, it is high time for you to put your knowledge and skills to practice before you do the tasks in the next section.
You have to explain to the students that concepts and skills learned in inequalities and triangles become meaningful only when they can transfer their learning to real life situations such as performing a task where they would be able to produce something.

Discuss to them the details of Activity No. 23 before letting them start. Give students adequate time to plan and create their outputs before allowing them to present their work in class.

After presentations, clinch the lesson by letting them share insights on the activity questions.

Answer Key to Activity 23:
Disaster Preparedness: Making It through the Rain

1. Possible Answers: Meaningful, Challenging, Fun, Interesting, Difficult
2. Possible Answers: Good planning makes the work faster; Cooperation and collaboration make the task easier and lighter; Mathematics is important in performing real-life tasks.
3. Yes because the concepts of hinge theorem and its converse is used in designing the range of distances between the feet of the folding ladder to make it stable enough for climbing.
4. The task makes me realize that mathematics is indeed important in performing real life tasks and in creating real life tools and equipment.
5. Note: Refer to the Product Column of Assessment Map for the answers
6. Example: Constructing an A-Frame House on different sizes of lot.

Answer Key to Activity 24: Final Construction of Concept Museum

Please refer to answer key of Activity 3, Hello, Dear Concept Contractor.

Teacher's Note and Reminders

SUMMARY

Activity 24 - Final Construction of Concept Museum

Directions: After learning all the concepts and skills on Inequalities in Triangles, take a final visit to your responses in Activity No.3—Hello, Dear Concept Contractor—of this module and make some modifications of or corrections to your responses and their corresponding justifications.

Questions:

1. How do you find the experience of designing?
2. What insights can you share from the experience?
3. Has the activity helped you justify inequalities in triangles? How?
4. How did the task help you see the real-world use of the concepts on inequalities in triangles?
5. Aside from designing a folding ladder, list down the real-life applications of concepts learned in Inequalities in Triangles from this module.
6. Can you think of other real-life applications of this topic?

Write three inequalities to describe the sides of this triangle:

Knowing TH > TX > HX, what question involving inequality should you use to check if they form a triangle?

Write two inequalities to describe angle 1.

Write the combined inequality you will use to determine the length of MK?

Write a detailed if-then statement about the marked angles.

Write two inequalities to describe angle 2.

MY CONCEPT MUSEUM on TRIANGLE INEQUALITIES

Come visit now!
You have completed the lesson on Inequalities in Triangles. Before you go to the next geometry lesson on Parallelism and Perpendicularity, you have to answer a post-assessment and a summative test.

Before giving the post-assessment, let the groups to review their answers to the items in pre-assessment and make corrections. Let them explain their letters of choices. You may ask them to explain why other choices are wrong.
POST-ASSESSMENT:

Let’s find out how much you already learn about this topic. On a separate sheet, write only the letter of the choice that you think best answers the question. Please answer all items.

1. Which of the following is not an inequality theorem for one triangle?
   a. Triangle Inequality Theorem 1 ($Ss \rightarrow Aa$)
   b. Triangle Inequality Theorem 3 ($S_1 + S_2 > S_3$)
   c. Exterior Angle Inequality Theorem
   d. Hinge Theorem

2. Which of the following angles is an exterior angle of $\triangle RPY$?
   a. $\angle 2$  b. $\angle 3$  c. $\angle 4$  d. $\angle 7$

3. Study the figure in no. 2. Notice that $m\angle 5 > m\angle 3$ and $m\angle 5 > m\angle 1$. Which theorem justifies these observations?
   a. Triangle Inequality Theorem 1 ($Ss \rightarrow Aa$)
   b. Triangle Inequality Theorem 2 ($Aa \rightarrow Ss$)
   c. Triangle Inequality Theorem 3 ($S_1 + S_2 > S_3$)
   d. Exterior Angle Inequality Theorem
4. Chris forms triangles by bending a 16-inch wire. Which of the following sets of wire lengths successfully form a triangle?

I. 4 in, 5 in, 6 in
II. 4 in, 4 in, 8 in
III. 4 in, 5 in, 7 in
IV. 3 in, 4 in, 9 in

a. I, II  
   b. III, IV  
   c. II, IV  
   d. I, III

5. From the inequalities in the triangles shown, Jarold concluded that $\angle OHM > \angle EHM$. Which theorem on inequalities in triangle justifies his answer?

![Diagram of triangle OHEM with sides 10, 8, 10, 7]

a. Triangle Inequality Theorem 3 ($S_1 + S_2 > S_3$) 
   b. Triangle Inequality Theorem 1 ($Ss \rightarrow A\alpha$) 
   c. Converse of Hinge Theorem 
   d. Hinge Theorem

6. Kyle has proved that $IS > IW$. Which of the following statements is NOT part of his proof?

![Diagram of triangle SWE with side 10 and angles 75°, 10°]

a. $ES \cong EW$  
   b. $\angle WEI + \angle SEI = 180$  
   c. $\angle EI \cong \angle EI$  
   d. $\angle W < \angle S$
7. What theorem should Kyle use to justify his proved statement in no. 5?
   a. Hinge Theorem
   b. Converse of Hinge Theorem
   c. Triangle Inequality Theorem 1 ($S_s \rightarrow A_a$)
   d. Triangle Inequality Theorem 3 ($S_1 + S_2 > S_3$)

8. Chloe studies the triangles in the figure carefully. Which should be her final conclusion?
   a. $\overline{TM} \cong \overline{TM}$
   b. $\overline{ET} > \overline{IT}$
   c. $\overline{IM} \cong \overline{EM}$
   d. $\angle EMT > \angle ITM$

9. Which theorem justifies Chloe’s conclusion in no. 8?
   a. Hinge Theorem
   b. Converse of Hinge Theorem
   c. Triangle Inequality Theorem 1 ($S_s \rightarrow A_a$)
   d. Triangle Inequality Theorem 3 ($S_1 + S_2 > S_3$)

10. In $\triangle GUD$, $GU = DU$ and $GD > DU$. Which of the following statements may NOT be true?
    a. $GU < GD - DU$
    b. $m\angle U > m\angle D$
    c. $m\angle U > m\angle G$
    d. $m\angle D = m\angle G$
11. In ∆TRY, if TR = 3, RY = 5, and TY = 2, which statement is true?
   a. \( m\angle R > m\angle Y \)       c. \( m\angle Y > m\angle T \)
   b. \( m\angle R > m\angle T \)       d. \( m\angle T > m\angle R \)

12. Which theorem justifies the then-statement in no. 11?
   a. Triangle Inequality Theorem 1 (Ss \( \rightarrow \) Aa)
   b. Triangle Inequality Theorem 2 (Aa \( \rightarrow \) Ss)
   c. Triangle Inequality Theorem 3 (\( S_1 + S_2 > S_3 \))
   d. Exterior Angle Inequality Theorem

13. From a rendezvous, hikers Oliver and Ruel who have uniform hiking speed walk in opposite directions—Oliver, eastward whereas Ruel, westward. After walking three kilometers each, both of them take right turns at different angles—Oliver at an angle of 30° and Ruel at 40°. Both continue hiking and cover another four kilometers each before taking a rest. To find out who is farther from the rendezvous, select the illustration that describes appropriately the problem.

   a. 
   
   b. 

   c. 
   
   d. 

   Ruel
   
   Oliver
14. Which theorem of inequality in triangles helps you in determining who is farther from the rendezvous?
   A. Hinge Theorem
   B. Converse of Hinge Theorem
   c. Triangle Inequality Theorem 1 \((S \rightarrow A)\)
   d. Triangle Inequality Theorem 3 \((S_1 + S_2 > S_3)\)

For items no. 15-20, use the situation described.

Your friend asks for your suggestion on how to raise the height of his tent without changing the amount of area it covers.

15. Which of the following designs meet the qualifications of your friend?

a. I and III  
b. II and III  
c. III and IV  
d. II, III, and IV
16. Which design/s is/are contradictory to your friend’s specifications?
   a. I only  b. IV only  c. I and II  d. I and IV

17. Which design requires more tent material?
   a. I  b. II  c. III  d. IV

18. The modified tents have equal heights. Which design is the most practical and easiest to assemble?
   a. I  b. II  c. III  d. IV

19. What theorem of inequality in triangles justifies design no. IV?
   a. Triangle Inequality Theorem 1 (Ss->Aa)
   b. Triangle Inequality Theorem 2 (Aa->Ss)
   c. Triangle Inequality Theorem 3 (S₁ + S₂ > S₃)
   d. Exterior Angle Inequality Theorem

20. Which insights have you learned from the tent designs?
   I. The steeper the roof of a tent, the less area it covers.
   II. The larger the roof angle of a tent, the wider the area it covers.
   III. Modifying a tent design does not always require money.
   a. III only  b. I, II  c. I, III  d. I, II, III

Answer Key to Post-Assessment:
